IT OPERATIONS & SLA ANALYTICS

Production Performance & Core Workload Telemetry

Engineered via Microsoft Power BI Desktop

Tool Architecture & Data Schema

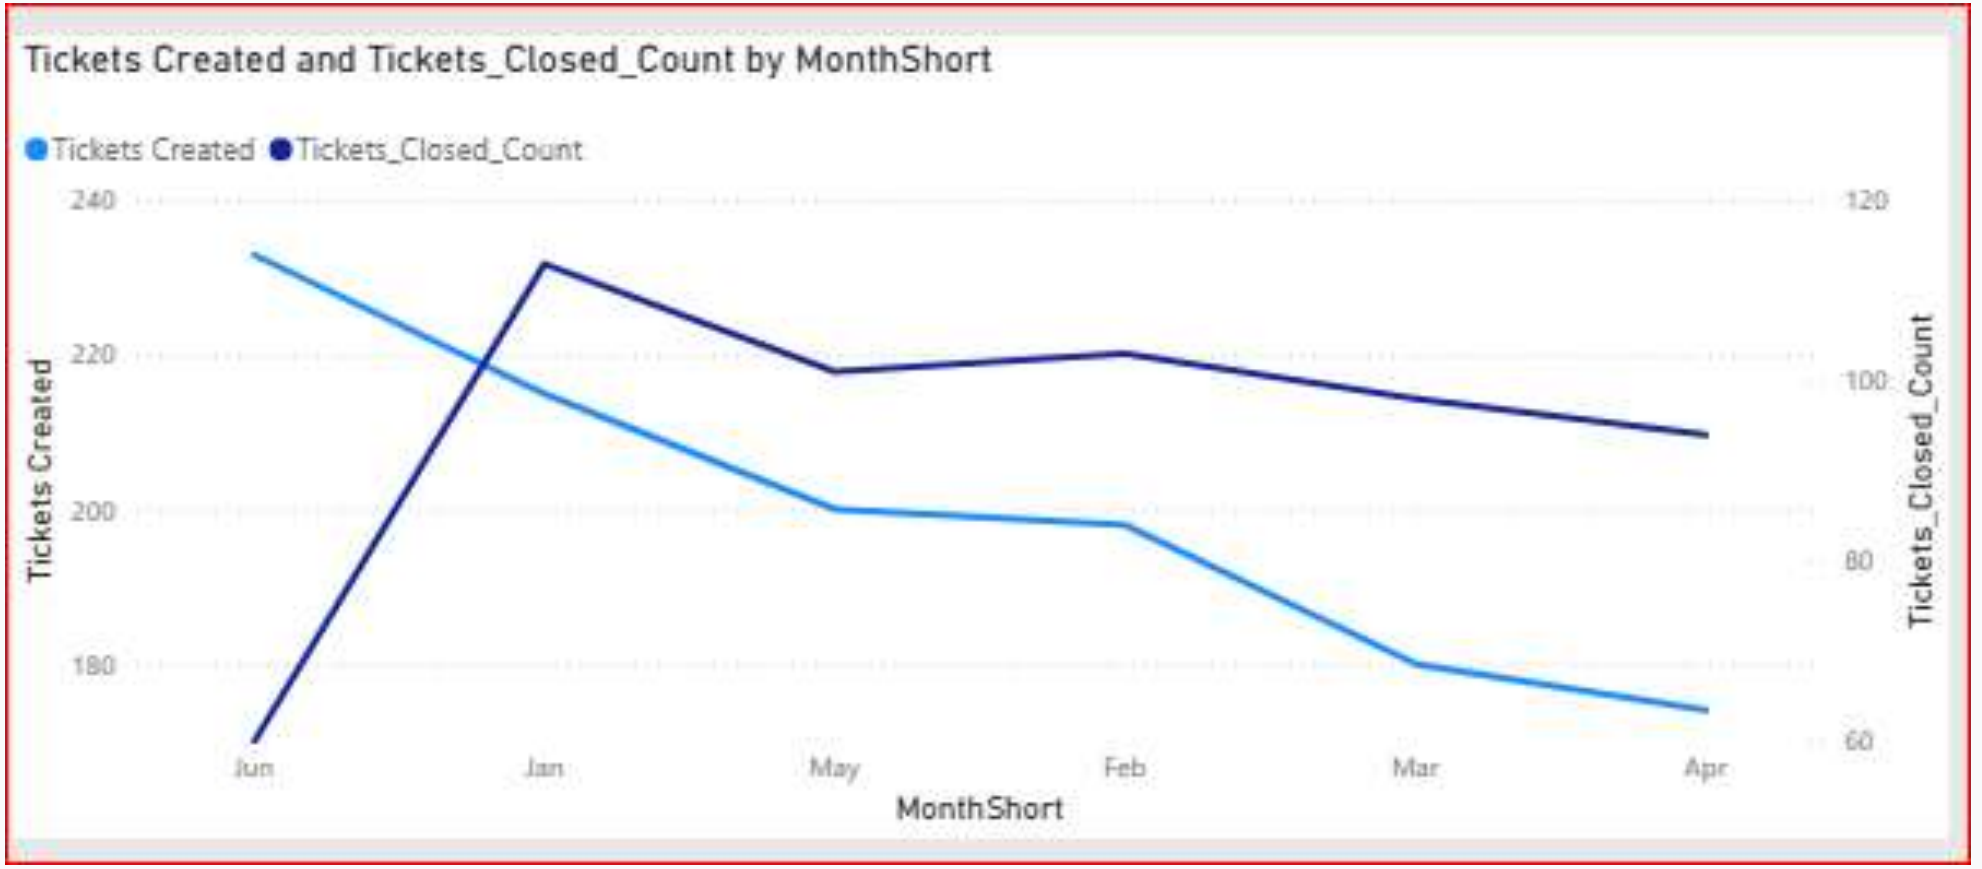

Data Model Framework

- Unified Star Schema Data Modeling Layer
- DimDate calendar lookup context joins directly with core operations table
- Eliminates raw time-series ambiguity across weekend boundaries
- Optimized data parsing handles high-volume queue telemetry points cleanly

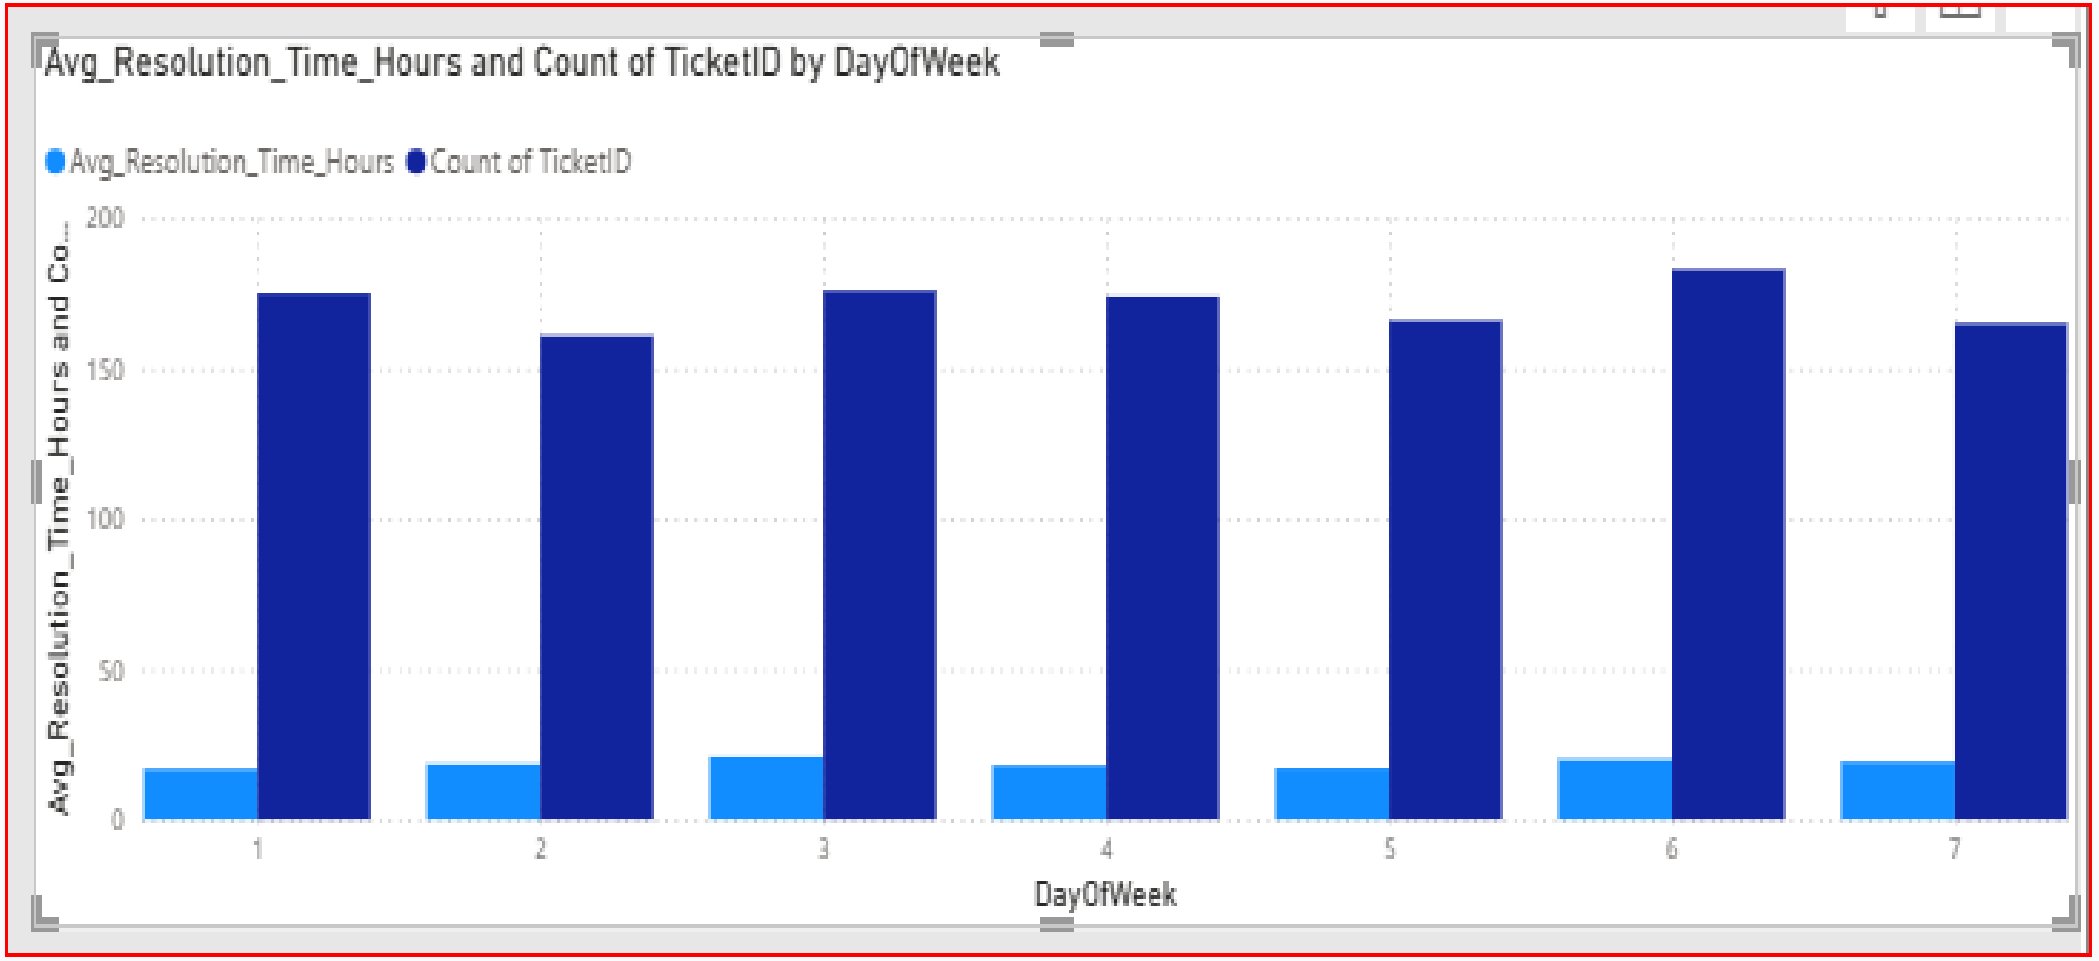

Active Calculated DAX Measures

- `Avg_CSAT_Score = AVERAGE(IT_Service_Desk_Tickets[CSAT_Score])`
- `Avg_ResolutionTime_Hours = AVERAGE(IT_Service_Desk_Tickets[ResolutionTime_Hours])`
- `FCR_Rate_Percentage = DIVIDE(COUNTAX(FILTER(..., [FCR]=1)), COUNT(...))`
- `Ticket_Backlog_Count = COUNTROWS(FILTER(..., [Status] <> "Closed"))`

Key Findings: Core Macro Metrics

TICKET BACKLOG

112

Active unresolved queue depth

AVG RESOLUTION TIME

18.58 Hrs

Overall team turnaround lifecycle

AVERAGE CSAT

3.39 / 5.0

Customer satisfaction benchmark

FIRST CONTACT RESOLUTION

64.17%

Initial touch deflection rate

Key Findings: Weekly Operational Hotspots

Isolated Bottleneck Analysis (Day 6 Telemetry)

• Absolute Inbound Volume Peak: Day 6 (Friday) records a massive influx of 183 tickets, creating the absolute highest operational stress point of the week.

• SLA Turnaround Degradation: Concurrently, the average resolution duration climbs significantly to 19.90 hours on Day 6, representing severe processing latency.

• Weekend Queue Carrying Over: The combination of maxed-out velocity delays and peak volume surges directly feeds the persistent 112 active backlog items.

• Targeted Exclusion Focus: Mid-week and initial data fields (including other Days) have been decoupled here to completely map out this critical weekend pipeline risk.

Conclusion & Strategic Intervention Roadmap

Actionable Mitigation Parameters

• Remediate the Friday Crisis Window: Align support desk schedules to step up engineer availability on Day 6 to instantly neutralize the 183-ticket influx.

• Targeted Customer Satisfaction Safeguards: Deploy automated short-form pulse surveys right after solving Day 6 incidents to track and solve the 3.39 CSAT baseline gap.

• Enforce Active Backlog Deflection Caps: Route less complex issues straight down the 64.17% FCR pipeline pathway to reliably lock and shrink the active 112-case backlog ceiling.

• Refine System-Wide SLA Alert Triggers: Calibrate automated workspace warnings in Power BI to alert support teams when active case times approach the 19.90-hour degradation threshold.
